

## Get Backup will help you to:

- \*Backup your precious data and restore it on any computer.
- \*Insure yourself against data loss.
- \*Automate the backup creation process.
- \*Set up the backup process once and let it care for your data.
- \*Keep important files on several computers synchronized.

Your computer's hard drive stores a lot of files with your valuable information. Bad things sometimes happen — and hard drives do crash. Such things tend to occur when they are least expected. So the best protection is to back up your data regularly. And this is where Get Backup comes in handy! All you need to do is restore your data if an emergency occurs.

Get Backup is a native Mac OS X backup software utility. This program is a simple and efficient tool for creating personal backups, suitable for both beginners and pros. It gracefully combines a simple and elegant user interface with powerful backup capabilities, such as automatic backups according to a schedule. Get Backup is quite flexible — you can reduce the backup archive size using compression tools, restore it on any computer as it utilizes tar technology, and much more.

In addition to file backup capabilities, Get Backup works as a synchronization tool allowing to coincide files and folders from one disk location to another. This helps to have the most recent and up-to-date file versions on both your desktop and laptop computers.

## Features at a Glance:

### Automate backup and sync processes using flexible scheduling

The customizable schedule tool allows to fully automate the backup and synchronization processes, so that backups are built and sync takes place on a regular basis (daily, weekly or monthly). Specify the backup and sync start time down to a minute. You can even create separate schedules for several backup and file sync projects.

### Back up to any mounted device/drive

The program allows you to save backups to any locally mounted device/drive, including FireWire, USB, ATA, SCSI, CD and DVD devices, or network volumes.

### Diverse Backup Methods:

Full — all selected files are saved, and the resulting archive replaces the previously created one.

Versioned — all selected files are saved in a new backup archive, and the previous archives remain intact.

Incremental — each time a backup is built, only the files that were changed are saved in the new backup archive.

### Integration

Integration with Apple iPhoto, Mail, iTunes and Address Book makes it very easy to access and backup your music, photos, e-mail and address records. Also, you can easily backup any other file or folder stored on your computer.

### Data Sync

Synchronize files and folders on your laptop and desktop computers, or any mounted drive. Two-way synchronization ensures that you have the most recent version of files you worked with, no matter which computer you are using. Schedule sync processes for more convenience and flexibility.

**Availability:** standard edition.

**Pricing:** Starting from \$39.95. Academic pricing is available.

### System Requirements:

Mac OS X 10.4 or later. 15 MB of free space for the application. Available in: English, German.
